

Harun Emrecan Karabağ

Unity Game Developer | Mobile Games | UI/UX Integration

Türkiye | Open to hybrid / part-time / project-based roles in İzmir | +90 507 049 3574 | harunemrecankarabag@gmail.com

Portfolio: hekyetmisbes.github.io | Itch.io: hekyetmisbes.itch.io | GitHub: github.com/hekyetmisbes | LinkedIn: linkedin.com/in/harunemrecankarabag

Professional Summary

Computer Engineering graduate and current M.Sc. student in Computer Animation and Game Technologies, focused on Unity, C#, mobile gameplay systems, UI/HUD implementation, narrative interaction design, and playable prototypes. Hands-on experience building Unity projects with player movement, mission flow, scoring, progression, validation logic, UI elements, player feedback, Android build preparation, Firebase-backed data features, game jam production, and published playable builds.

Strong fit for a Unity Game Developer role focused on improving existing mobile games, integrating UI/UX designs into Unity, fixing bugs, polishing user experience, preparing builds, and developing new mobile game prototypes. Comfortable reading existing Unity projects, working with Git, iterating based on feedback, and maintaining clean, organized, and sustainable project structure.

Role Fit for Mefe Games Studio

- Interested in supporting existing mobile games through bug fixing, UI/HUD improvements, performance-aware changes, player experience polish, and build preparation.
- Hands-on experience with Unity UI, menus, HUD elements, scoring, progression, settings-style flows, onboarding/tutorial-style logic, narrative interactions, and player feedback systems.
- Familiar with Android-focused Unity workflows, responsive mobile UI thinking, Firebase-backed data concepts, and basic third-party service integration mindset.
- Able to share a portfolio, GitHub repositories, and playable Itch.io builds that demonstrate Unity/C# game logic, UI implementation, gameplay systems, rapid prototyping, and learning progress.
- Open to hybrid, part-time, project-based, or junior/intern-level collaboration models depending on project needs and schedule alignment.

Core Skills

Game Development: Unity 2D/3D, C#, mobile game development, casual games, puzzle/quiz mechanics, narrative games, platformer mechanics, simulation prototypes, game jam prototyping, new prototype development

Unity UI/UX Integration: Unity UI, Canvas, menus, HUD elements, score screens, settings screens, result screens, responsive UI, Figma-to-Unity implementation mindset, player feedback

Mobile Development: Android build preparation, mobile input handling, resolution and aspect-ratio awareness, device compatibility mindset, mobile-friendly UI flows, build testing

Gameplay Systems: player movement, interactions, scoring, progression, mission flow, collectibles, validation logic, message decoding, resource gathering, win/loss conditions, onboarding/tutorial logic, game-state flow

Unity Workflow: Scene Management, Prefab workflows, GameObjects, Components, Animation basics, Physics basics, Input System basics, Cinemachine basics, build pipeline awareness

Bug Fixing & Testing: debugging, bug reproduction, issue analysis, gameplay testing, QA checklist mindset, iterative improvements, crash/debugging awareness, problem solving

Performance Mindset: mobile optimization awareness, memory-conscious implementation, object lifecycle management, pooling awareness, CPU/GPU performance fundamentals, profiling-oriented debugging habits

Services & Data: Firebase Realtime Database basics, JSON/data handling concepts, SQLite concepts, analytics/event tracking awareness, leaderboard/achievement system interest

Code Quality & Workflow: OOP, SOLID learning, clean and readable code, modular scripts, reusable components, project organization, Git, GitHub, GitLab, documentation

Languages: Turkish native, English B2+ written and spoken

Selected Game Projects

Delivery Driver - Open-City Delivery Simulation Prototype

[GitHub](#) | [Playable Build](#)

Stylized Unity 3D driving and delivery prototype focused on player control, mission flow, route guidance, minimap navigation, UI/HUD feedback, progression, and performance-aware systems.

Technologies: Unity 3D, C#, Input System, Cinemachine, SQLite, UI/HUD systems, NPC traffic AI, pooling, Git

- Built and evolved a Unity 3D driving prototype combining car control, delivery missions, route guidance, minimap markers, speedometer HUD, settings UI, and player progression.
- Implemented gameplay systems around pickup/delivery flow, money/XP/level progression, achievements, cargo damage, quest outcomes, and player statistics.
- Worked on simulation-oriented systems such as NPC traffic behavior, road graph concepts, obstacle avoidance, spawn/pooling logic, and performance-conscious update structures.
- Published a downloadable Windows build on Itch.io and maintained the project through iterative updates, bug fixes, gameplay improvements, and development logs.

Fog Bridge - Atmospheric Narrative Puzzle Game

[Playable Build](#)

Short GameDev.tv Game Jam 2026 project about two isolated guards slowly building understanding through paper plane messages across a fog-covered chasm.

Technologies: Unity, C#, narrative puzzle design, fictional alphabet decoding, interaction flow, resource gathering, bridge rebuilding progression, Itch.io release

- Designed and released a short atmospheric narrative puzzle experience centered on distance, fear, language, and connection for a game jam theme around connection.
- Built a readable narrative loop where the player receives paper plane messages, decodes a fictional alphabet, replies across the fog, gathers materials, and gradually rebuilds a forgotten bridge.
- Focused on quiet emotional pacing, symbolic worldbuilding, storybook-inspired presentation, and small interaction-driven progression that turns isolation into understanding.
- Published a downloadable Windows build on Itch.io, expanding the portfolio with a complete jam-scale release focused on narrative interaction and puzzle readability.

The Platform - 2D Platformer Game

[GitHub](#) | [Playable Build](#)

Released 2D platformer where players collect stars, avoid obstacles, complete levels, and interact with a simple cyberpunk-themed gameplay loop.

Technologies: Unity 2D, C#, platformer mechanics, level flow, collectibles, ShaderLab/HLSL, Git

- Developed 2D movement, obstacle interaction, level progression, collectible-driven goals, and completion conditions for a playable platformer experience.
- Designed and implemented a simple but readable gameplay loop around collecting stars, navigating levels, avoiding hazards, and completing objectives.
- Published a Windows build on Itch.io, including install instructions and a downloadable executable package.

Flag Quiz - Android Mobile Quiz Game

[GitHub](#)

Mobile quiz game where players identify country flags through a simple, accessible, and score-driven gameplay loop.

Technologies: Unity 2D, C#, Firebase Realtime Database, Android, Unity UI, Figma, Git

- Built a mobile-friendly quiz loop with random flag presentation, answer validation, scoring, progress flow, and end-of-round feedback.

- Used Firebase Realtime Database concepts to manage flag names and country-code data, supporting dynamic content handling and service integration practice.
- Designed UI concepts with Figma and prepared Android-focused gameplay interactions with responsive player input and readable mobile UI flow.

Movidle Game - Movie Guessing Game

[GitHub](#)

Movie guessing game based on IMDB Top 250 data, comparing player guesses by movie attributes such as genre, year, director, country, and star.

Technologies: Java, game logic, validation systems, CSV/data handling, UI flow

- Developed guessing-game logic where the system randomly selects a target movie and compares player predictions through multiple movie attributes.
- Implemented limited-attempt gameplay with feedback-driven comparison, success/failure states, and data-backed movie selection.
- Used this project as an early game-logic foundation before later strengthening Unity/C# gameplay development skills.

Professional Experience

Software Engineer Intern

Jul 2025 – Aug 2025

Erciyes University IT Department

Kayseri, Türkiye

- Developed structured and maintainable software components using ASP.NET Core 8 and EF Core, strengthening clean code, debugging, feature implementation, and software engineering discipline.
- Worked with data models, service logic, documentation, and iterative improvements to support stability, readability, maintainability, and clean project organization.
- Used version control and integration-oriented development practices, building habits relevant to peer review, collaborative engineering, technical documentation, and end-to-end feature ownership.

Research Intern - 2247-C STAR

Feb 2024 – Jul 2024

TÜBİTAK

Advisor: Asst. Prof. Saltuk Buğra Selçuklu

- Conducted research on agent-based simulation and optimization, strengthening analytical thinking, experimentation, and structured problem-solving.
- Worked with simulation-oriented concepts relevant to decision flows, system behavior, game logic, and performance-conscious interactive software design.
- Applied an analytical approach to complex system behavior, supporting faster diagnosis of technical and design problems in gameplay and software systems.

Education

Hacettepe University

2026 – Present

M.Sc. in Computer Animation and Game Technologies

Expected Graduation: Jan 2027

Erciyes University

2020 – 2025

B.Sc. in Computer Engineering

GPA: 3.00 / 4.00

Certificates

- More C# Programming and Unity - Coursera: [Certificate](#)

- Introduction to C# Programming and Unity - Coursera: [Certificate](#)
- Hypercasual Fundamentals - BTK Akademi: [Certificate](#)
- Version Control: Git and GitHub - BTK Akademi: [Certificate](#)
